

STANFORD EXPLORATION PROJECT

Report Number 50, November 1986

Kamal Al-Yahya, Biondo Biondi, Jon Claerbout, Joe Dellinger, John Etgen, Paul Fowler,
Clement Kostov, Pete Mora, Francis Muir, Rick Ottolini, Chuck Sword,
Jos van Trier and Marta Woodward

SEP-50 --- TABLE OF CONTENTS

Preface

SEP Golden Volume.....	v
------------------------	---

Deconvolution

<i>Kostov, C. and Rocca, F.</i> , Estimation of residual wavelets	1
<i>Al-Yahya, K. and Mora, P.</i> , Water bottom multiple deconvolution	23
<i>Ottolini, R. and Rocca, F.</i> , Movies of data-lag histograms with application to deconvolution research.....	35

Wave Propagation

<i>Sword, C., Claerbout, J., and Sleep, N.</i> , Finite-element propagation of acoustic waves on a spherical shell.....	43
<i>Muir, F.</i> , An automaton for propagating waves through heterogeneous media	79
<i>Dellinger, J., and Mora, P.</i> , Accurate finite-difference derivative operators by inversion	85
<i>Claerbout, J.</i> , Mass-spring networks to simulate the 4-th order Laplacian	95
<i>Claerbout, J., and Dellinger, J.</i> , Eisner's reciprocity paradox and its resolution: Part I, the paradox	99
<i>Claerbout, J.</i> , Slippery edges.....	103
<i>Claerbout, J., and Dellinger, J.</i> , Eisner's reciprocity paradox and its resolution: Part II, the resolution	107

Migration Velocity Analysis

<i>van Trier, J., and Rocca, F.</i> , Autofocusing of migrated data	113
<i>Al-Yahya, K.</i> , Migration velocity analysis of field data: preliminary results	129
<i>Fowler, P.</i> , Migration velocity analysis: preliminary data tests.....	139

Migration

<i>Etgen, J.</i> , Prestack reverse time migration of shot profiles.....	151
<i>Biondi, B.</i> , Migration using short-time Fourier transforms	171
<i>Woodward, M.J.</i> , Three-pass 3-d migration on a hexagonal grid.....	195
<i>Levin, S.</i> , Parallel finite-difference migration in practice	207
<i>Al-Yahya, K. and Fowler, P.</i> Prestack residual migration	219

Inversion

<i>Mora, P.</i> , Elastic wavefield inversion of reflection and transmission data.....	231
<i>Woodward, M.J.</i> , Iterative tomography: addendum	261

Interactive Interpretation

<i>Claerbout, J.</i> , Hyperbola overlay program development: a personal engagement	269
<i>Ottolini, R.</i> , Comments on “Hyperbola overlay program development”	279

Computers

<i>Claerbout, J.</i> , A canonical program library	281
<i>Ottolini, R.</i> , Signal processing with stochastic memories.....	291
<i>Ottolini, R.</i> , Update on workstation raster speed	297
Phone Directory	298
Research Personnel.....	300
Sponsors of the Stanford Exploration Project.....	304

SEP Golden Volume

This volume marks the fiftieth report of the Stanford Exploration Project. These reports now cover thirteen years, and include 26 semi-annual reports, 23 Ph.D. theses, and one textbook. Students trained at SEP have enjoyed considerable success as geophysicists, six as faculty members in leading U.S. and foreign universities, and fourteen as researchers in the petroleum industry. Twelve more students are now working on Ph.D. degrees at SEP.

Perhaps now is a good time to ask where we have been, where we are now, and where we are headed. SEP was initially chartered for the purpose of pursuing “fundamental research in reflection seismology.” Through the years we have explored many areas both directly and indirectly related to this central goal, as perusal of the table of contents of this or most any other report will show. At first, finite-difference migration was the *raison d’être* of SEP, and we are proud of having pioneered the application of wave propagation physics to exploration geophysics. SEP-1 came out in September, 1973. In all of 1973, there were no papers whatsoever in Geophysics on the subject of migration. In 1974 there were but two papers, and there were only four migration talks at the SEG annual meeting in October 1973. Now, of course, every SEG or EAEG meeting has many sessions on migration, and there are so many papers on the topic that SEG has published a collection of key reprints.

We are also proud to note (Leading Edge, October, 1986) that of the seven papers considered for the SEG’s “Outstanding Paper in Geophysics” award this year, two were SEP contributions. These papers reflect current trends in SEP research. In the early days, geophysicists analyzed signals and noises for one-dimensional deconvolution problems. Now we know that classic migration is the first step of an optimization process. We are learning the subsequent steps towards uniting physics and statistics in the

broader context of velocity analysis. We are excited about the directions this has led us, and expect this viewpoint to receive more attention by our profession.

SEP began with 23 sponsoring organizations in 1973, and has grown in support to 41 sponsors in 1986. (And 16 of the 23 charter members are with us still!) Without the generosity of our sponsors, of course, we could not maintain such a large and active research program, nor obtain the state-of-the-art computing facilities which make testing of our ideas possible. But more than just the financial support and the donations of field data sets, we have benefited from the many suggestions and discussions with sponsor representatives, at the SEP meetings, during visits to Stanford, and through countless telephone and mail conversations. On this, the occasion of our fiftieth volume of SEP reports, we want to thank all of you who have supported our work and made it all possible.

P.J.F., R.O., and J.F.C.
