Reproducible electronic documents

Matt Schwab and Jon Claerbout

We give you our system for filing scientific computational research: Reproducible electronic documents. These documents enable you – or anyone with access to your files – to handily regenerate your results. Thus your research and your software can be shared and reused. Reproducible electronic documents rely on UNIX makefiles, a few file naming conventions, and a small set of make rules and definitions. [Two pages of motivation and summary.](#)

Universal rules for reproducible documents

- The White Paper ([postscript](#)) ([html](#)) explains reproducible electronic documents and is submitted to Computer in Physics (CIP). This article is the best introduction to reproducible documents.
- The [software package \(tar.gz\)](#) ([tar.Z](#)) that accompanies the CIP article contains a complete, reproducible document and a generic set of GNU make rules. Use this package if you plan to test the idea of reproducibility and if you consider adapting it for your purposes.
- Our [GNU make \(tar.gz\)](#) ([tar.Z](#)) version is a patched copy of the official make-3.74. If you have a GNU make version higher than 3.74, you do not need our patched version.
