

Jon Claerbout, Stanford University

## What can you do with these methods?

- Build models to fit data using nonstationary statistics.
- Estimate and remove a source wavelet (blind decon deblur)
- Bring randomly positioned data to a uniform Cartesian grid.
- Fill data gaps. Interpolate beyond aliasing (sometimes).

- Transform residuals to IID (Independent, Identically Distributed).
- Swap easily among L1, L2, hyperbolic, and inequality penalties.
- Stretch a signal unevenly to match another. Images too.
- Predict price based on diverse aspects.

- Model robustly (multivariate median versus the mean).
- Remove crosstalk in multichannel signals (vector data).
- Shave models with Occam's razor outdoing the L1 norm.
- Join the world of BIG DATA by grasping many aspects of back projection.

# Data Fitting with Nonstationary Statistics

October 2018
